

## **Assignment 6 (10 ptos)**

Due Date: March 4th, 23:59pm, BR time.

Using a Page Rank signal computed over the documents of our Web collection, modify the ranking function of your search engine such that the final score is a linear combination of the Vector model score and the Page Rank score.

Run your modified Search Engine over a set of 20 Web queries provided to you as examples, collect the top 5 results for each of these queries and upload them in a Trix sheet provided to you. No need to write a report for this one, all you have to do is produce the top 5 results for each query and upload them.
